

The **Infant Communication Lab** at the **University of Pittsburgh** (affiliated with the Pittsburgh Early Autism Study) is conducting a research study to examine motor and communication development in infants who have an older sibling with autism spectrum disorder (ASD). We are enrolling babies ages **6 months and younger** who have an older brother or sister with ASD and whose families live in the greater Pittsburgh area.

We will visit you and your baby in your home at a time convenient for you. Following an initial visit at **6 months**, visits will take place monthly from **8 to 20 months**, with 2 follow-up visits at **24 and 36 months**. During the in-home visits, we will videotape babies as they crawl, walk, play with toys, and play with you. When your child is 36 months old, we will ask you to come to the University of Pittsburgh for a diagnostic evaluation. Compensation is provided for study participation and for travel to evaluations.
